International Institutional Collaborations

Increasing connectivity, integration and exchange of knowledge, practices and techniques across countries around the world is referred to as globalization. Though, we have reached great heights in terms of oral health research, still there are challenges that need to be addressed. Hence, these challenges can be resolved and, at the same time, improved community oral health by the means of collaborations and partnerships across the globe.

The importance of international institutional collaborations not only promote collaborative research projects, faculty exchange and student exchange, but also promote the development of education models in dentistry and to implement the same globally. It is also important to develop competency-based dental education model and its relevance to implementation of the same. The adoption of advances in technology in dental education promotes collaborations and encourages resource sharing among institutions across the globe. A multicentric research approach help us to find the nature of a problem and also, at the same time, find a solution to handle the same across various ethnicities across the globe. Keeping all of the above in mind, the only way to progress in research is by the means of International Institutional Collaborations that is the need of the hour.
